

Package ‘RoME’

July 23, 2026

Type Package

Title Multiple Checks on MEDITS Trawl Survey Data

Version 0.2.4

Description Provides quality checks for MEDITS (International Bottom Trawl Survey in the Mediterranean) trawl survey exchange data tables (TA (Haul data), TB (Catch data), TC (Biological data), TE (Biological individual data), TL (Litter data)). The main function `RoME()` calls all check functions in a defined sequence to perform a complete quality control of TX (Generic exchange data) data, including header validation, controlled-vocabulary checks, cross-table consistency tests, and biological plausibility checks. No automatic correction is applied: the package detects errors, warns the user, and specifies the type of error to ease data correction. Checks can be run simultaneously on multi-year datasets. An embedded 'shiny' application is also provided via `run_RoME_app()`. References describing the methods: MEDITS Working Group (2017).

Depends R (>= 4.0)

assTL

*TL association between categories and sub-categories***Description**

List of the allowed association between categories and subcategories in litter data table (TL)

Usage

```
data("assTL")
```

Format

A data frame with 42 observations on the following 2 variables.

LITTER_CATEGORY List of litter categories

‘LITTER_SUB-CATEGORY’ List of litter sub-categories

Details

The table is used to check the correctness of the categories/sub-categories associations in litter data tables (TL).

Author(s)

W. Zupa

Source

Anonymus (2017) "MEDITS-Handbook. Version n. 9. MEDITS Working Group"

References

Anonymus (2017) "MEDITS-Handbook. Version n. 9. MEDITS Working Group"

Examples

```
data(assTL)
str(assTL)
```

checkHeader	<i>Function to check the correctness of the headers.</i>
-------------	--

Description

Function to check the correctness of the headers for haul data (TA), catch data (TB), biological data (TC), individual data (TE), litter data (TL) tables.

Usage

```
checkHeader(dataframe, template,wd,suffix)
```

Arguments

dataframe	Table to check
template	Template used for the check.
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

This function produce an error, stopping the check procedure to avoid cascade errors.

Value

The function returns TRUE if no error occurs, while FALSE is returned when there is more than one valid hauls. In the logfile and in the console is reported the list of all the records in which the inconsistency is detected.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd=tempdir()
suffix= "2020-03-05_time_h17m44s55"
checkHeader(RoME::TA,"TA",wd,suffix)
checkHeader(RoME::TB,"TB",wd,suffix)
checkHeader(RoME::TC,"TC",wd,suffix)
```

check_0_fieldsTA	<i>Checks the presence of 0 fields in TA</i>
------------------	--

Description

The function checks the presence of 0 fields in the following haul data table (TA, according to MEDITS protocol) fields: WING_OPENING, WARP_DIAMETER and VERTICAL_OPENING

Usage

```
check_0_fieldsTA(DataTA,wd,suffix,year)
```

Arguments

DataTA	Haul data table according to MEDITS protocol (TA)
wd	working directory path defined by the user
suffix	Suffix string of the Logfile
year	reference year for the analysis

Value

The function returns a boolean value. It is FALSE in case 0 values are detected in the TA table's fields

Author(s)

Isabella Bitetto [aut,cre] <bitetto@coispa.it>; Walter Zupa [aut, cre] <zupa@coispa.it>

References

Anonymus (2017) "MEDITS-Handbook. Version n. 9. MEDITS Working Group"

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
check_0_fieldsTA(RoME::TA,wd,suffix, year=2007)
```

check_abundance

*Box-plots of swept-area-standardised abundance indices***Description**

This function reads matching MEDITS TA (haul metadata) and TB (catch numbers) tables for a single survey year, computes the swept area for each haul, derives haul-level abundance indices expressed as individuals per km^2 , and produces one or more box-plots that summarise the distribution of those indices by species. The plots are written to the folder '`<wd>/Graphs/Abundance/`' and a logfile is produced under '`<wd>/Logfiles/`' with a summary of any quality-control issues encountered.

Usage

```
check_abundance(ResultDataTA, ResultDataTB, year, wd,
  suffix = NULL, distance_unit = "km", min_hauls = 5L)
```

Arguments

ResultDataTA	Data frame containing at least the columns COUNTRY, YEAR, MONTH, DAY, HAUL_NUMBER, DISTANCE (towed length) and WING_OPENING (gear width in metres).
ResultDataTB	Data frame containing at least COUNTRY, YEAR, MONTH, DAY, HAUL_NUMBER, GENUS, SPECIES, TOTAL_NUMBER_IN_THE_HAUL and FAUNISTIC_CATEGORY.
year	Single numeric value identifying the survey year to analyse.
wd	Writable directory where the function will place 'Logfiles/' and 'Graphs/Abundance/'.
suffix	Optional text appended to the logfile name. When missing a timestamp is used.
distance_unit	Either "km" (default) or "nmi". The value determines the conversion factor applied to DISTANCE.
min_hauls	Minimum number of valid hauls a species must appear in to be plotted. Defaults to 5.

Details

A swept area is first computed for every haul from TA. The function then merges TA and TB. Hauls that lack swept area information or hauls whose total number of individuals is missing (or equal to zero when not allowed by the faunistic category) are discarded and reported in the logfile. Species occurring in fewer than min_hauls valid hauls are also removed. The remaining species are sorted alphabetically and divided into blocks of 36; one image file is produced for each block so that labels remain readable even in years with many species.

The function returns TRUE when no data-quality issues were found and FALSE otherwise.

Value

Logical scalar (TRUE if no errors, FALSE otherwise).

Author(s)

W. Zupa.

Examples

```
wd <- tempdir()
check_abundance(ResultDataTA = RoME::TA,
                 ResultDataTB = RoME::TB,
                 year = 2007,
                 wd = wd)
```

check_area	<i>Check if TX files have the same area</i>
------------	---

Description

The function works with data of a single year of survey and checks if TX files have the same area code.

Usage

```
check_area(DataTA, DataTB, DataTC, DataTE=NA, DataTL=NA, year, wd, suffix)
```

Arguments

DataTA	Haul data table according to MEDITS protocol (TA)
DataTB	Catch data table according to MEDITS protocol (TB)
DataTC	Biological data table according to MEDITS protocol (TC)
DataTE	Individual biological data table according to MEDITS protocol (TE)
DataTL	Litter data table according to MEDITS protocol (TL)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

TA, TB and TC tables are mandatory while TE and TL could be used where available.

Value

The function returns TRUE if no error occurs, while FALSE is returned when there are differences in the AREA code among the TX tables.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
DataTA = RoME::TA
DataTB = RoME::TB
DataTC = RoME::TC
DataTE = RoME::TE
DataTL = RoME::TL
check_area(DataTA, DataTB,DataTC,DataTE=NA,DataTL=NA,year=2012, wd, suffix)
```

check_associations_category_TL

Check correctness of TL categories

Description

Check correctness of association between category and sub-category in TL consistent according to INSTRUCTION MANUAL VERSION 9

Usage

```
check_associations_category_TL(DataTL, assTL, year, wd, suffix)
```

Arguments

DataTL	Litter data table (TL) according to MEDITS protocol.
assTL	data frame with the association between TL (litter table) categories and sub-categories
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The package uses a table of association between TL categories and sub-categories that is resident in the data folder of the package as assTL.rda file.

Value

The function returns always TRUE, because the outcome of the function is a warning that does not lock the execution of the 'RoME' checks. The presence of inconsistencies in the data is reported in the logfile stored in the "Logfiles" subdirectory of the "wd" user-defined directory.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
DataTL = RoME::TL
check_associations_category_TL(DataTL, assTL, year=2012, wd, suffix)
```

check_bridles_length	<i>check of bridles length correctness</i>
----------------------	--

Description

The function performs consistency checks of the values in the "BRIDLES_LENGTH" field of the hauls data table (TA).

Usage

```
check_bridles_length(DataTA, year, wd, suffix)
```

Arguments

DataTA	Haul data table according to MEDITS protocol (TA)
wd	working directory path defined by the user
suffix	Suffix string of the Logfile
year	reference year for the analysis

Details

The field BRIDLES_LENGTH can assume value 100 between 10-200 m of depth or 150 between 200-800 m. The function highlights also that MEDITS handbook recommends to increase the bridle length to 200 m in depths deeper than 500 m, reporting a warning in the logfile. Empty (NA) records in "BRIDLES_LENGTH" will be eliminated being the presence of empty fields already checked by check_no_empty_fields

Value

The function returns always TRUE, because the outcome of the function is a warning that does not lock the execution of the 'RoME' checks. The presence of inconsistencies in the data is reported in the logfile stored in the "Logfiles" subdirectory of the "wd" user-defined directory.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
check_bridles_length(RoME::TA, year=2012, wd, suffix)
```

check_class	<i>Check of field's class</i>
-------------	-------------------------------

Description

The function checks the class of the fields included in the selected table TX using the dictionary table reported in the class data frame.

Usage

```
check_class(data, tab, suffix, wd)
```

Arguments

data	one of the different data tables defined by the MEDITS protocol (TX)
tab	character string defining the type of table used in the analysis. Allowed values: "TA", "TB", "TC", "TE" and "TL".
suffix	Suffix string of the Logfile
wd	working directory path defined by the user

Value

The function returns TRUE if no error are detected, while FALSE value is returned if any of the checked fields in the selected table has a not expected class of data.

Author(s)

W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd = tempdir()
check_class(data=RoME::TA, "TA", wd=wd, suffix="test_file")
check_class(data=RoME::TB, "TB", wd=wd, suffix="test_file")
check_class(data=RoME::TC, "TC", wd=wd, suffix="test_file")
check_class(data=RoME::TE, "TE", wd=wd, suffix="test_file")
check_class(data=RoME::TL, "TL", wd=wd, suffix="test_file")
```

check_consistencyTA_distance

Consistency check of distance in TA

Description

The function checks whether the distances reported in the haul data (TA) are consistent with the hauls duration.

Usage

```
check_consistencyTA_distance(DataTA, year, wd, suffix)
```

Arguments

DataTA	Haul data table according to MEDITS protocol (TA)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

Check between duration of the haul and distance (tolerance of 15%). The function does not check the presence of NA values in the DISTANCE field that are removed from the analysis. The eventual presence of empty records in the DISTANCE field is checked by the check_no_empty_fields function.

Value

The function generates warning messages in the logfile and returns always TRUE.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd=tempdir()
suffix="2020-03-05_time_h17m44s55"
check_consistencyTA_distance(RoME::TA,year=2012,wd,suffix)
```

```
check_consistencyTA_duration
```

Consistency check of hauls duration in TA

Description

The function checks whether the durations reported in the haul data (TA) are consistent with the differences between HAULING_TIME and SHOOTING_TIME.

Usage

```
check_consistencyTA_duration(DataTA, year, wd, suffix)
```

Arguments

DataTA	Haul data table according to MEDITS protocol (TA)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The DURATION, SHOOTING_TIME and HAULING_TIME fields have to be consistent

Value

The function returns a boolean value. It is FALSE in case one or more durations in the TA table are not consistent with the differences between HAULING_TIME and SHOOTING_TIME.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
check_consistencyTA_duration(RoME::TA,year=2012,wd,suffix)
```

check_date_haul	<i>Check of date consistency</i>
-----------------	----------------------------------

Description

Check if in TB, TC and TE the date by haul is the same of the one reported in TA

Usage

```
check_date_haul(DataTA, Data, year, wd, suffix)
```

Arguments

DataTA	Haul data table according to MEDITS protocol (TA)
Data	Data frame of one of the following TX table: TB, TC, TE, TL
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The function check whether in one of the TX file allowed in Data argument there are date consistent with the one reported in the haul data table (TA).

Value

The function returns TRUE if no error occurs, while FALSE is returned when in the Date data frame there is one or more date not included in the TA tables.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
DataTA = RoME::TA
Data = RoME::TB
year=2009
check_date_haul(DataTA, Data, year, wd, suffix)
```

check_depth	<i>Check between start depth and end depth</i>
-------------	--

Description

Check if that difference between start depth and end depth is not greater than 20%

Usage

```
check_depth(DataTA, year, wd, suffix)
```

Arguments

DataTA	Haul data table according to MEDITS protocol (TA)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The difference between start depth and end depth should be not greater than 20%.

Value

The function returns always TRUE because the outcome of the function is a warning that does not block the execution of the 'RoME' checks. The presence of inconsistencies between start depth and end depth is reported in the logfile stored in the "Logfiles" subdirectory of the "wd" user-defined directory.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
check_depth(RoME::TA, year=2007,wd,suffix)
```

check_dictionary	<i>Check of the dictionary of specific fields</i>
------------------	---

Description

The function checks whether the values contained in specific fields are consistent with the allowed values of the dictionaries.

Usage

```
check_dictionary(ResultData, Field, Values, year, wd, suffix)
```

Arguments

ResultData	Haul data table according to MEDITS protocol (TA)
Field	Name of the specific field of the selected TX table
Values	Vector of the allowed values for the field to be checked
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The function checks the consistence of the contained in specific fields with the relative allowed values. The check is performed on the hauls data table (TA), the catch data table (TB), the biological data table (TC) and the individual biological data (TE).

Value

The function returns TRUE if no error occurs, while FALSE is returned when there are differences between the field values and the reference dictionaries. In the logfile is reported the list of all the records in which the inconsistency is detected.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
Field = "COURSE"
Values = c("R", "N")
DataTA = RoME::TA
year = 2007
check_dictionary(ResultData = DataTA, Field, Values, year, wd, suffix)
```

check_distance	<i>Check of distance consistency</i>
----------------	--------------------------------------

Description

The function checks whether there are inconsistencies between the DISTANCE field values in the TA table and the distances computed from the geographical coordinates of each haul.

Usage

```
check_distance(DataTA, year, wd, suffix)
```

Arguments

DataTA	Haul data table formatted according to the MEDITS protocol (TA table).
year	Reference year for the analysis.
wd	Working directory path defined by the user.
suffix	Suffix string to uniquely identify the output logfile and plots.

Details

The comparison between the DISTANCE field and the distance computed from shooting and hauling coordinates is performed with a tolerance threshold of 30%.

The geographic distance is calculated using the function `distGeo()` from the `geosphere` package, which computes the shortest path (great-circle distance) between two points on the Earth's ellipsoid (WGS84) using coordinates in decimal degrees.

Coordinates in the TA table are usually expressed in degrees and decimal minutes. These are automatically converted into decimal degrees using the internal function `MEDITS.to.dd()` before the computation.

Value

The function always returns TRUE. Its purpose is to generate warnings for hauls where the recorded DISTANCE differs significantly from the computed geographic distance.

Warnings are saved in a logfile located in the `Logfiles` subdirectory of the specified working directory. Additionally, for hauls with discrepancies, graphical maps are generated and saved in the `Graphs` subdirectory to support visual inspection and correction.

Hijmans, R. J. (2019). *geosphere: Spherical Trigonometry*. R package version 1.5-10.
<https://cran.r-project.org/package=geosphere>

Examples

```
wd <- tempdir()
suffix <- "2020-03-05_time_h17m44s55"
year <- 2007
check_distance(RoME::TA, year, wd, suffix)
```

check_dm

Check of "WING_OPENING" and "VERTICAL_OPENING" fields

Description

The function checks the values in "WING_OPENING" and "VERTICAL_OPENING" field are in the allowed ranges (see INSTRUCTION MANUAL VERSION 9 MEDITS 2017).

Usage

```
check_dm(DataTA, year, wd, suffix)
```

Arguments

DataTA	Haul data table according to MEDITS protocol (TA)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The value ranges defined in the INSTRUCTION MANUAL VERSION 9 MEDITS (2017) for wing and vertical opening expressed in dm are respectively 50 - 250 and 10 - 100.

Value

The function returns an error in case wing values are out of the allowed ranges, while it returns warnings in case vertical opening values are out of the allowed ranges and in case wing opening and vertical opening values are not integer numbers.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd=tempdir()
suffix="2020-12-16_time_h10m52s55"
check_dm(RoME::TA,year=2007,wd,suffix)
```

check_G1_G2

Check of length measurements for G1 and G2 species

Description

Check if for G1 and G2 species the length measurements are present in TC

Usage

```
check_G1_G2(DataTC, year, wd, suffix)
```

Arguments

DataTC	Biological data table according to MEDITS protocol (TC)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

This check uses a new support table (list_g1_g2) containing the list of MEDITS G1 and G2 species and verify if the length has been collected for the selected species for each haul. If the length is lacking for any species in any haul, a warning message is given in the logfile.

Value

The function returns always TRUE because the outcome of the function is a warning that does not block the execution of the 'RoME' checks. If the length is lacking for any species in any haul, a warning message is given in the logfile.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
check_G1_G2(RoME::TC,year=2007,wd,suffix)
```

check_hauls_TATB	<i>Check of TA hauls in TB</i>
------------------	--------------------------------

Description

The function check the presence of the TA (haul data table) hauls in the TB (catch data table)

Usage

```
check_hauls_TATB(DataTA,DataTB,year,wd,suffix)
```

Arguments

DataTA	Haul data table according to MEDITS protocol (TA)
DataTB	Catch data table according to MEDITS protocol (TB)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The function check the presence of the TA (haul data table) hauls in the TB (catch data table)

Value

The function returns TRUE if no error occurs, while FALSE is returned when an inconsistency is detected between haul and catch tables.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
DataTA <- RoME::TA
DataTB <- RoME::TB
year = 2008
check_hauls_TATB(DataTA,DataTB,year,wd,suffix)
```

check_hauls_TATL	<i>Check presence of TA hauls in TL</i>
------------------	---

Description

Check if the hauls in TA are present in TL

Usage

```
check_hauls_TATL(DataTA, DataTL, year, wd, suffix)
```

Arguments

DataTA	Haul data table according to MEDITS protocol (TA)
DataTL	Litter data table according to MEDITS protocol (TL)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The function checks whether all the hauls present in hauls data table (TA) are included in the litter data table (TL).

Value

The function returns always TRUE because the outcome of the function is a warning that does not lock the execution of the 'RoME' checks. The list of the hauls not present in the TL table is reported in the logfile stored in the "Logfiles" subdirectory of the "wd" user-defined directory.

Author(s)

I. Bitetto, W. Zupa

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
DataTA = RoME::TA
DataTL = RoME::TL
year=2008
check_hauls_TATL(DataTA,DataTL,year,wd,suffix)
```

check_hauls_TBTA	<i>Check of TB hauls in TA</i>
------------------	--------------------------------

Description

The function check the presence of the TB (catch data table) hauls in the TA (haul data table)

Usage

```
check_hauls_TBTA(DataTA, DataTB, year, wd, suffix)
```

Arguments

DataTA	Haul data table according to MEDITS protocol (TA)
DataTB	Catch data table according to MEDITS protocol (TB)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The function check the presence of the TB (catch data table) hauls in the TA (haul data table)

Value

The function returns TRUE if no error occurs, while FALSE is returned when an inconsistency is detected between haul and catch tables.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
DataTA <- RoME::TA
DataTB <- RoME::TB
check_hauls_TBTA(DataTA,DataTB,year=2008,wd,suffix)
```

check_hauls_TLTA	<i>Check presence of TL hauls in TA</i>
------------------	---

Description

Check if the hauls in TL are present in TA

Usage

```
check_hauls_TLTA(DataTA,DataTL,year,wd,suffix)
```

Arguments

DataTA	Haul data table according to MEDITS protocol (TA)
DataTL	Litter data table according to MEDITS protocol (TL)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The function checks whether all the hauls present in litter data table (TL) are included in the haul data table (TA).

Value

The function returns TRUE if no error occurs, while FALSE is returned when there are missing hauls in the TA table.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
DataTA = RoME::TA
DataTL = RoME::TL
year=2008
check_hauls_TLTA(DataTA,DataTL,year,wd,suffix)
```

check_haul_species_TCTB

Check species of TC in TB

Description

The function checks whether all the species present in TC (biological data table) must be listed in TB (catch data table)

Usage

```
check_haul_species_TCTB(DataTB, DataTC, year, wd, suffix)
```

Arguments

DataTB	catch data table according to MEDITS protocol (TB)
DataTC	Biological data table according to MEDITS protocol (TC)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The function returns a warning message in the logfile.

Value

If a species present in the TC table (biological data table) is not reported in the TB (catch data table) an error message is reported in the logfile and a "Critical_errors" file is saved in the working directory reporting details on the errors.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
year=2008
check_haul_species_TCTB(RoME::TB, RoME::TC, year, wd, suffix)
```

check_identical_records

Check of identical records in TX tables

Description

The function checks whether there is one or more identical records in the selected type of table (TX).

Usage

```
check_identical_records(Data, year, wd, suffix)
```

Arguments

Data	one of the different data tables defined by the MEDITS protocol (TX)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The routine uses all the table format (TX) defined by the MEDITS protocol.

Value

The function returns TRUE if no error occurs, while FALSE is returned when there is one or more identical record in the given TX table.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
Data = RoME::TA
check_identical_records(Data, year=2007, wd, suffix)
```

 check_individual_weightTC

Check of observed and estimated total weight in the haul

Description

The function compares the observed

Usage

```
check_individual_weightTC(DataTC,LW=NA,year,wd,suffix,verbose=FALSE)
```

Arguments

DataTC	Biological data table according to MEDITS protocol (TC)
LW	data frame of the a and b parameters by species, area and sex
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile
verbose	boolean parameter, if TRUE returns messages about the progress of the elaboration

Details

The warning is given when difference between the sum of estimated individual weights (by haul, species and sub-samples) and the WEIGHT_OF_THE_SAMPLE_MEASURED is greater than 50% for at least one record. This check is based on the table LW contained in package, where the length-weight relationship coefficients are reported by species, area and sex.

Value

The file Comparison_estimated_observed_weight_in_TC.csv is automatically saved in the working directory in order to easily detect the samples with this differences in total weight. For all the records the percentage difference between observed and estimated weight is reported.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
TC = RoME::TC[1:20,]
check_individual_weightTC(DataTC=TC,year=2007, wd=wd, suffix=suffix)
```

check_individual_weightTE

Consistency of individual weights (according to length-weight relationship)

Description

The function checks the difference between observed and estimated individual weight in percentage.

Usage

```
check_individual_weightTE(DataTE,LW,year, wd, suffix,verbose=FALSE)
```

Arguments

DataTE	Individual biological data table according to MEDITS protocol (TE)
LW	data frame of the length-weight parameters by species, area and sex
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile
verbose	boolean parameter, if TRUE returns messages about the progress of the elaboration

Details

For each individual is calculated the estimated weight according to length-weight relationship coefficient stored in LW table and the difference between observed and estimated individual weight in percentage. Moreover, this function checks if for G1 species has been collected the weight or if has been entered the value ND, that is not allowed.

Value

If for at least one record the difference between observed and estimated individual weight is greater than 20% a warning is given in Logfile.dat and a table named TE_with_estimated_weights.csv is automatically produced in order to allow the user to easily eventually detect the errors. For all the records the percentage difference between observed and estimated weight is reported.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
DataTE = RoME::TE[1:6,]
check_individual_weightTE(DataTE,year=2012, wd=wd, suffix=suffix,verbose=TRUE)
```

check_length	<i>Check of length classes in TC</i>
--------------	--------------------------------------

Description

The function checks the consistency of length classes in the TC table for the MEDITS survey. It verifies that the recorded length classes for each species fall within the expected ranges reported in a reference table of species-specific length limits. Warnings for inconsistencies are written to a CSV file for easier downstream analysis instead of being printed extensively in the log file.

Usage

```
check_length(DataTC, DataSpecies = NA, year, wd, suffix,
             DataTargetSpecies = RoME::DataTargetSpecies)
```

Arguments

DataTC	Biological data table (TC) formatted according to the MEDITS protocol.
DataSpecies	A data frame with species-specific reference length limits. If not provided, the internal DataTargetSpecies dataset included in the package is used by default.
year	Reference year for the analysis.
wd	Working directory path defined by the user, where log files and CSV output will be saved.
suffix	Suffix string for naming the log and CSV files, allowing unique identification of output files from different runs.
DataTargetSpecies	Reference dataset with species-specific information on length ranges, used as default if DataSpecies is not provided.

Details

The function filters the TC data for the selected year and checks each length class recorded against the minimum (LMIN01) and maximum (LMAX99) length values defined for the corresponding species in the reference table. It also checks for negative or missing length class values. All detected issues are collected and saved in a CSV file for clear reporting, instead of generating verbose outputs in the log file.

Species with less than 50 observations in TC are excluded from the check by default, to focus the analysis on more frequently recorded species. The function ensures robust handling of missing (NA) values in both the TC table and the reference datasets to avoid false warnings.

A short summary of the check results is written to the .dat logfile. If no inconsistencies are detected, a message indicating successful validation is saved.

Value

Returns TRUE, invisibly. Detected inconsistencies are written to a CSV file in the working directory; if no issues are found, the CSV file remains empty apart from the header row.

Author(s)

W. Zupa, I. Bitetto

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
DataTC <- RoME::TC[1:20,]
DataSpecies <- NA
suffix <- "2020-03-05_time_h17m44s55"
check_length(DataTC, DataSpecies = NA, year = 2007, wd, suffix)
```

check_length_class_codeTC

Consistency check of LENGTH_CLASS

Description

The function checks the consistency of field LENGTH_CLASSES_CODE in TC

Usage

```
check_length_class_codeTC(DataTC, Specieslist=RoME::TM_list, year, wd, suffix)
```

Arguments

DataTC	Biological data table according to MEDITS protocol (TC)
Specieslist	Information related to target species as reported in the TM list
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The function checks whether the LENGTH_CLASS_CODE by species are consistent with those reported in the Specieslist dataset. When Specieslist is NA the TM_list dataset (included in the package) is used by default.

Value

If the LENGTH_CLASS_CODE in TC table (biological data table) are not consistent with COD-LON field in Specieslist dataset (or TM_list if Specieslist is NA) an error is returned. In case a LENGTH_CLASS_CODE is not reported for the given species no check is done and the function returns a warning message.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
DataTC <- RoME::TC
wd=tempdir()
suffix= "2020-03-05_time_h17m44s55"
check_length_class_codeTC(DataTC,Specieslist=NA,year=2007,wd,suffix)
```

check_mat_stages	<i>Consistency of maturity stages</i>
------------------	---------------------------------------

Description

Consistency check of maturity stages, according to the faunistic category and sex

Usage

```
check_mat_stages(Data, year, wd, suffix, stages = RoME::mat_stages)
```

Arguments

Data	Biological data table (TC) or individual biological data table (TE) according to MEDITS protocol
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile
stages	data frame with the list of allowed maturity stages for faunistic category as defined by the mat_stages dataset included in the package

Details

The check on maturity stage is performed for the species included in the new TM list, where selachians and bony fish are distinguished. The check is applied to the following faunistic categories: Ao, Ae, B, C and Bst.

Value

The function always returns TRUE generating a warning message when inconsistencies in the maturity stages are detected, being difficult to define for all GSAs the year in which occurred the switch from the "old" MEDITS maturity scale to the current MEDITS scale.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
DataTC <- RoME::TC
wd=tempdir()
suffix= "2020-03-05_time_h17m44s55"
check_mat_stages(DataTC,year=2007, wd, suffix)
```

check_nbtotTB

Check total number of individuals in TB

Description

The function checks that the total number of individuals is consistent with the sum of the individuals per sex

Usage

```
check_nbtotTB(DataTB, year, wd, suffix)
```

Arguments

DataTB	Catch data table according to MEDITS protocol (TB)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The function checks that the total number of individuals is consistent with the sum of the individuals per sex

Value

The function returns TRUE if no error occurs, FALSE if one or more inconsistencies in the individuals number is detected.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
DataTB = RoME::TB
year=2007
check_nbtotTB(DataTB,year, wd, suffix)
```

check_nb_per_sexTC	<i>Consistency check of number of individuals</i>
--------------------	---

Description

The function checks the consistency of the number of individuals by sex measured (NO_OF_INDIVIDUAL_OF_THE_ABOVE field in the biological data table, TC) with the sum of the individuals by sex, length class and maturity stage (NUMBER_OF_INDIVIDUALS_IN_THE_LENGTH_CLASS_AND_MATURITY_STAGE field in TC)

Usage

```
check_nb_per_sexTC(DataTC, year, wd, suffix)
```

Arguments

DataTC	Biological data table according to MEDITS protocol (TC)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The function checks the consistency of the number of individuals by sex measured (NO_OF_INDIVIDUAL_OF_THE_ABOVE field in the biological data table, TC) with the sum of the individuals by sex, length class and maturity stage (NUMBER_OF_INDIVIDUALS_IN_THE_LENGTH_CLASS_AND_MATURITY_STAGE field in TC)

Value

The function returns TRUE if no error occurs, while FALSE is returned when there inconsistencies between the following biological data table (TC): NO_OF_INDIVIDUAL_OF_THE_ABOVE_SEX_MEASURED and NUMBER_OF_INDIVIDUALS_IN_THE_LENGTH_CLASS_AND_MATURITY_STAGE. If the field number per sex is found completely empty, the routine will stop and will produce automatically a .csv file (TC_file_with_computed_nb_per_sex.csv) with the nb per sex column filled in. The user will have to copy and paste the column in the original file and run again the code.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
DataTC = RoME::TC
year=2007
check_nb_per_sexTC(DataTC,year,wd,suffix)
```

check_nb_TE	<i>Consistency of number of individuals sampled for weight and ageing in TE</i>
-------------	---

Description

The function checks the consistency of number of individuals sampled for weight and ageing in TE

Usage

```
check_nb_TE(DataTE, year, wd, suffix)
```

Arguments

DataTE	Individual biological data table according to MEDITS protocol (TE)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

this function verify the consistency of the check-fields:

- NO_PER_SEX_MEASURED_IN_SUB_SAMPLE_FOR_OTOLITH
- NO_PER_SEX_MEASURED_IN_SUB_SAMPLE_FOR_WEIGHT
- NO_PER_SEX_MEASURED_IN_SUBSAMPLE_FOR_AGEING

These fields are compared to the number of records present in TE by sex, length class and haul.

Value

The function returns FALSE in case inconsistencies are detected in the individual biological data table (TE)

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
DataTE = RoME::TE
year=2012
check_nb_TE(DataTE,year, wd, suffix)
```

check_nm_TB

*Check of consistency in number per sex set "not mandatory" in TB***Description**

Check if in TB there are the total number, number of females, males and undetermined for species G1

Usage

```
check_nm_TB(DataTB, year, wd, suffix)
```

Arguments

DataTB	Catch data table according to MEDITS protocol (TB)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

for the species G1 are not allowed that the fields related to total number, number of females, number of males and number of undetermined are simultaneously null, according to MEDITS manual version 9 of 2017.

Value

The function returns TRUE if no error occurs, FALSE if one or more inconsistencies in the individuals number per sex in TB is detected.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
DataTB = RoME::TB
year=2007
check_nm_TB(DataTB, year, wd, suffix)
```

check_no_empty_fields *Check empty fields in TA, TB, TC, TE and TL*

Description

All the fields, except to HYDROLOGICAL_STATION and OBSERVATIONS, must be not empty for valid hauls

Usage

```
check_no_empty_fields(Data, year, wd, suffix)
```

Arguments

Data	one of the different data tables defined by the MEDITS protocol (TX)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The routine uses all the table format (TX) defined by the MEDITS protocol.

Value

The function returns TRUE if no error occurs, while FALSE is returned when there is one or more empty record in the given TX table.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
Data = RoME::TA
year=2007
check_no_empty_fields(Data, year, wd, suffix)
```

check_numeric_range	<i>Check of the values range in specific fields</i>
---------------------	---

Description

The function checks whether the values contained in specific fields are consistent within the allowed range of values.

Usage

```
check_numeric_range(Data, Field, Values, year, wd, suffix)
```

Arguments

Data	data table according to MEDITS protocol (TX)
Field	Name of the specific field of the selected TX table
Values	Vector of the allowed values for the field to be checked. The first two values are mandatory and indicate the extreme values of the range. The other optional values are single numerical exceptions to the field allowed values.
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The function checks the consistence of the values contained in specific fields with the relative allowed range of values. The function allows to include exceptions to the allowed range of values for specific values. The check is performed on any of the "TX" data tables.

Value

The function returns TRUE if no error occurs, while FALSE is returned when inconsistencies are detected. The list of all the records in which the inconsistency is detected is reported in the logfile.

Author(s)

W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
Field = "SHOOTING_DEPTH"
Values = c(10,800,0)
Data = RoME::TA
year <- unique(Data$YEAR)[1]
check_numeric_range(Data, Field, Values, year, wd, suffix)
```

check_position	<i>Plot of haul positions</i>
----------------	-------------------------------

Description

The function generate three different plots, haul start position, haul end position and start and end positions together.

Usage

```
check_position(DataTA, year, wd, suffix)
```

Arguments

DataTA	Haul data table according to MEDITS protocol (TA)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The haul position maps are saved in the Graph directory allocated in the user defined wd directory.

Value

The function generate three maps of the haul position that are stored in the Graph folder allocated in the user defined wd directory

Author(s)

W. Zupa, I. Bitetto

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
year=2007
check_position(RoME::TA,year,wd,suffix)
```

check_position_in_Med *Check of haul position in Mediterranean Sea*

Description

The function checks whether the position of the haul is in the Mediterranean Sea area or falls on the land.

Usage

```
check_position_in_Med(DataTA, year, wd, suffix)
```

Arguments

DataTA	Haul data table according to MEDITS protocol (TA)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The function uses the `haul_at_sea()` function to check whether the position of the haul is in the Mediterranean Sea area or falls on the land.

Value

The function returns a boolean value. It is FALSE in case one or more haul positions fall out of the Mediterranean Sea area defined by the shapefile *MedSea* included in the package.

Author(s)

W. Zupa, I. Bitetto

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix="2020-03-05_time h17m44s55"
DataTA = RoME::TA
year=2007
check_position_in_Med(DataTA, year, wd, suffix)
```

check_quadrant	<i>Check start and end quadrant for each haul</i>
----------------	---

Description

Function checking that the shooting quadrant and the hauling quadrant are the same.

Usage

```
check_quadrant(ResultDataTA, year, wd, suffix)
```

Arguments

ResultDataTA	Haul data table according to MEDITS protocol (TA).
year	reference year for the analysis
wd	Working directory selected by the user.
suffix	Suffix string of the Logfile.

Details

The function returns a warning if shooting and hauling quadrant are not the same.

Value

The function returns always TRUE, because the outcome of the function is a warning that does not lock the execution of the 'RoME' checks. The presence of inconsistencies in the data is reported in the logfile stored in the "Logfiles" subdirectory of the "wd" user-defined directory.

Author(s)

I. Bitetto, W. Zupa

References

For the definition of the quadrants, please refer to: Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd=tempdir()
suffix= "2020-03-05_time_h17m44s55"
TA <- RoME::TA
year=2007
check_quadrant(TA,year,wd,suffix)
```

check_quasiidentical_records

Function checking the presence of quasi-identical records.

Description

Two or more "quasi-identical records" occurred when all the fields are respectively equal, except: TYPE_OF_FILE, AREA, GEAR, VESSEL, YEAR, RIGGING, DOORS, for TA table; TYPE_OF_FILE, AREA, VESSEL, YEAR for TB and TC tables. These specific fields are allowed to be identical.

Usage

```
check_quasiidentical_records(Result,year,wd,suffix)
```

Arguments

Result	Haul data table according to MEDITS protocol (TA), or Catch data table (TB) or Biological data table (TC).
year	reference year for the analysis
wd	Working directory selected by the user.
suffix	Suffix string of the Logfile.

Details

The checks always returns TRUES generating warning messages in the logfile if any quasi-identical record was found. In a given survey the following fields (of TA table) should be identical: 'TYPE_OF_FILE', 'AREA', 'VESSEL', 'GEAR', 'RIGGING', 'DOORS' and 'YEAR'. The function checks whether any differences occur in these fields in each yearly survey. The same think is done for all the other tables where these fields occur.

Value

The function always returns TRUE reporting the presence of quasi-identical records in the logfile.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd=tempdir()
suffix= "2020-03-05_time_h17m44s55"
year=2007
# example using TA table
TA <- RoME::TA
check_quasiidentical_records(TA,year,wd,suffix)

# example using TB table
TB <- RoME::TB
check_quasiidentical_records(TB,year,wd,suffix)

# example using TC table
TC <- RoME::TC
check_quasiidentical_records(TC,year,wd,suffix)
```

check_raising

Comprehensive consistency checks between MEDITS TB and TC files

Description

check_raising() performs a suite of integrity checks on a pair of MEDITS survey tables – *TB* (catch-at-haul) and *TC* (biological subsamples) – for one survey year. All inconsistencies are written to a plain-text logfile; the routine never stops at the first error, so you always get the full list of issues detected.

Usage

```
check_raising(ResultDataTB, ResultDataTC, year, wd, suffix = NULL)
```

Arguments

ResultDataTB	A data.frame containing the MEDITS TB table for one or more years.
ResultDataTC	A data.frame containing the MEDITS TC table for one or more years.
year	Single integer. The survey year to be checked.
wd	Character string. A writable directory where sub-folders ‘Logfiles/’ (and ‘Graphs/’, currently unused) will be created.
suffix	Optional character string appended to the logfile name. When NULL (default) a timestamp-based suffix is generated automatically.

Details

The function executes **five** independent validations:

1. *Weight consistency* – When more than one subsample exists for a given haul/species in TC, the sum of WEIGHT_OF_THE_FRACTION must equal TOTAL_WEIGHT_IN_THE_HAUL recorded in TB.

2. *Raising factor* – For each subsample the ratio *molt* given by `WEIGHT_OF_THE_FRACTION / WEIGHT_OF_THE_SAMPLE_MEASURED` must be ≥ 1 .
3. *Sex-specific numbers* – For every combination haul * species * sex the raised total of individuals in TC must match TB columns `NB_OF_FEMALES`, `NB_OF_MALES` or `NB_OF_UNDETERMINED`.
4. *Total individuals (TC -> TB)* – For every haul/species the sum of raised numbers across all sexes in TC must equal `TOTAL_NUMBER_IN_THE_HAUL` in TB. This catches cases where an entire sex is missing from TC.
5. *Internal TB consistency* – Within TB the sum of the three sex-specific columns must equal `TOTAL_NUMBER_IN_THE_HAUL` for each haul/species.

If any of these checks fails, an explanatory line is appended to the logfile 'Logfiles/Logfile_.dat'. The function finally returns a single logical value: TRUE when no errors are detected, FALSE otherwise.

Tidy-evaluation is used inside the **dplyr** pipelines; the following symbols are declared in [globalVariables](#) to avoid "no visible binding" notes during R CMD check: COUNTRY, YEAR, HAUL_NUMBER, GENUS, SPECIES, WEIGHT_OF_THE_FRACTION, WEIGHT_OF_THE_SAMPLE_MEASURED, NUMBER_OF_INDIVIDUALS_IN_THE_LENGTH_CLASS, SEX, NB_OF_FEMALES, NB_OF_MALES, NB_OF_UNDETERMINED, TOTAL_WEIGHT_IN_THE_HAUL, TOTAL_NUMBER_IN_THE_HAUL, codedsex, N, molt, raised, RaisedSex, RaisedTotal, n_subsamples, total_fraction, SumSexTB.

Value

Logical scalar: TRUE if the dataset passes all checks, FALSE otherwise.

Author(s)

W. Zupa, I. Bitetto, M. T. Spedicato

See Also

[dplyr](#) for the data-manipulation verbs used under the hood.

Examples

```
# The following datasets come from the 'RoME' package demo data
DataTB <- RoME::TB
DataTC <- RoME::TC

res <- check_raising(DataTB, DataTC, year = 2015, wd = tempdir())
if (res) message("All checks passed!")
```

check_rubincode	<i>Function checking the correctness of species MEDITS code and faunistic category according to TM reference list</i>
-----------------	---

Description

The TM list contained in the INSTRUCTION MANUAL VERSION 9 MEDITS 2017 is taken as reference to check the correctness of species code and category. The function is applied to catch data table (TB), Biological data table (TC) and Individual data table (TE).

Usage

```
check_rubincode(ResultData,year,TMlist,wd,suffix)
```

Arguments

ResultData	alternatively: Catch data table (TB), Biological data table (TC) and Individual data table (TE).
year	reference year for the analysis
TMlist	TM_list reference list
wd	Working directory selected by the user.
suffix	Suffix string of the Logfile.

Details

The checks execution is stopped if any mismatching record was found.

Value

The function returns always TRUE if used to check TB tables, indicating in the logfile the species codes not present in TM list. If unexpected rubin codes are detected in both TC and TE tables an error (FALSE value) is reported in the logfile, interrupting the function running.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd=tempdir()
suffix= "2020-03-05_time_h17m44s55"
year=2007

# example using TB table
TB <- RoME::TB
check_rubincode(TB,year,TM_list,wd,suffix)

# example using TC table
TC <- RoME::TC
check_rubincode(TC,year,TM_list,wd,suffix)
```

check_smallest_mature *Check for mature individuals below literature thresholds in TC data*

Description

This function verifies the consistency of maturity information in TC data by detecting mature individuals whose lengths are smaller than the smallest mature size reported in the literature for each species and sex. Detected inconsistencies are saved in a CSV file for traceability and further review, while a concise summary is written in the log file.

Usage

```
check_smallest_mature(ResultData, year, MaturityParameters, TargetSpecies,
  wd, suffix)
```

Arguments

ResultData	Biological data table (TC) formatted according to the MEDITS protocol. This table should contain length-class, sex, and maturity stage information for all recorded hauls.
year	Reference year for the analysis. Only records from the specified year are processed.
MaturityParameters	Table with bibliographic parameters describing the smallest mature individual observed for each species and sex, and the related reference sources.
TargetSpecies	Table containing information on target species, including taxonomic codes and faunistic categories used to identify relevant maturity checks.
wd	Working directory where the function writes log files and CSV outputs.
suffix	String appended to filenames of log and CSV files to distinguish outputs from different runs.

Details

The function processes the TC data for the selected year and examines each species listed in the `MaturityParameters` table. For each mature individual (i.e. not coded as immature stages), it checks whether the length class is smaller than the bibliographic minimum threshold, allowing a 10% tolerance buffer to account for biological variability. If such individuals are detected, they are recorded in a CSV file including:

- GSA
- Year
- Species
- Sex
- Haul number
- Length class (mm)
- Threshold applied (mm)
- Literature threshold (mm)
- Bibliographic reference
- Type of file
- Type of warning

A concise message summarizing how many records were written to the CSV is printed to the log file (.dat). If no inconsistencies are found, the function logs a message indicating that all maturity stages are above bibliographic thresholds.

The check uses the updated `DataTargetSpecies` table for consistency with current species definitions and codes.

Value

The function always returns TRUE. Its purpose is to perform quality checks and log potential issues, but it does not interrupt the execution of other routines in the `RoME` package.

Author(s)

W. Zupa, I. Bitetto

References

Anonymus. 2017. *MEDITS-Handbook*. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix <- "2020-03-05_time_h17m44s55"
TC <- RoME::TC
year <- 2007
check_smallest_mature(
  TC,
  year,
```

```

    RoME::Maturity_parameters,
    RoME::DataTargetSpecies,
    wd,
    suffix
  )

```

check_spawning_period *Check consistency of maturity stages with respect to the spawning period*

Description

This function checks whether maturity stages reported in TC (or TE) are consistent with the reproductive period of each species. It detects three situations:

- Immature individuals caught during the spawning period but with lengths above the bibliographic threshold (maximum L50 plus 20%).
- Mature individuals caught outside the spawning period.
- Mature individuals caught outside the spawning period and with lengths smaller than the smallest mature individual reported in the literature.

The check uses bibliographic information from the `Maturity_parameters` table, including L50 values and spawning months.

Usage

```

check_spawning_period(ResultDataTA, ResultDataTC, year,
  Maturity_parameters, DataTargetSpecies, wd, suffix)

```

Arguments

<code>ResultDataTA</code>	Haul data table (TA) according to MEDITS protocol.
<code>ResultDataTC</code>	Biological data table (TC) or alternatively the individual data table (TE), according to MEDITS protocol.
<code>year</code>	Reference year for the analysis.
<code>Maturity_parameters</code>	Table containing bibliographic information on L50, reproductive season, and smallest mature size for species and sexes.
<code>DataTargetSpecies</code>	Reference table for target species, including faunistic categories and other relevant data.
<code>wd</code>	Working directory selected by the user, where logfiles and CSV outputs will be saved.
<code>suffix</code>	Suffix string to append to output filenames, useful to distinguish between multiple runs.

Details

The function reads information from `Maturity_parameters` to identify the reproductive period (spawning season) of each species and sex. It then compares each record in TC or TE with these periods:

- Immature individuals (maturity codes 0, 1, 2A) are flagged if they are captured during the spawning period and have lengths exceeding the bibliographic threshold (maximum L50 + 20%).
- Mature individuals are checked to verify whether they were caught outside the defined spawning period.
- Among mature individuals outside the spawning period, those with lengths smaller than the smallest mature specimen reported in literature are additionally flagged.

Warnings are written both to a .dat logfile and to a CSV file for easier downstream analysis. The CSV output includes details on GSA, year, haul number, species, sex, length class, spawning period months, month of capture, and type of warning.

Value

The function always returns TRUE, as it is designed to produce warnings rather than halt execution of further routines in the RoME package.

Author(s)

W. Zupa, I. Bitetto

References

Anonymous. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix <- "2020-03-05_time_h17m44s55"
year <- 2007
TA <- RoME::TA
TC <- RoME::TC
check_spawning_period(
  ResultDataTA = TA,
  ResultDataTC = TC,
  year = year,
  Maturity_parameters = RoME::Maturity_parameters,
  DataTargetSpecies = RoME::DataTargetSpecies,
  wd = wd,
  suffix = suffix
)
```

check_species_TBTC	<i>Function checking if all the target species in the catch data table (TB) are in Biological data table (TC)</i>
--------------------	---

Description

This function verifies the presence of the target species (that is a subset of the all the species caught, reported in TB), in the TC table, where additional information (apart from number and weight) are collected.

Usage

```
check_species_TBTC(ResultTB,ResultTC,year,DataSpecies,wd,suffix)
```

Arguments

ResultTB	Catch data table(TB).
ResultTC	Biological data table (TC).
year	reference year for the analysis
DataSpecies	Information related to target species.
wd	Working directory selected by the user.
suffix	Suffix string of the Logfile.

Details

This function gives a warning message, thus the execution is not stopped when some target species are lacking in TC; the user is informed in the Logfile.

Value

The function returns always TRUE, because the outcome of the function is a warning that does not lock the execution of the 'RoME' checks.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd=tempdir()
suffix = "2020-03-05_time_h17m44s55"
year=2007
ResultTB=RoME::TB
ResultTC=RoME::TC
check_species_TBTC(ResultTB,ResultTC,year,RoME::DataTargetSpecies,wd,suffix)
```

check_step_length_distr

The function verifies that in TC the length measures are reported with the correct precision.

Description

Fishes and cephalopods length classes must have full or half step (in case of LENGTH_CLASSES_CODE=1 only full). All the measures , must be integer numbers.

Usage

```
check_step_length_distr(ResultData,year,wd,suffix)
```

Arguments

ResultData	alternatively: Biological data table (TC) and Individual data table (TE).
year	reference year for the analysis
wd	Working directory selected by the user.
suffix	Suffix string of the Logfile.

Details

According to the MEDITS protocol, Fishes and cephalopods length measurement must collected full or half step and all the measures, must be integer numbers. Empty (NA) records in LENGHT_CLASS field are removed from the analysis being empty fields already detected by check_no_empty_fields function.

Value

The function returns TRUE if no error occurs, while FALSE is returned when the step is not correctly used. In the logfile is reported the list of all the records in which the inconsistency is detected.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
data <- RoME::TC
wd=tempdir()
year = 2007
suffix= "2020-03-05_time_h17m44s55"
check_step_length_distr(data,year,wd,suffix)
```

check_stratum	<i>Function that checks the consistency between start and end depth according to the stratum.</i>
---------------	---

Description

Start depth and end depth of each haul should be in the same stratum.

Usage

```
check_stratum(ResultData,year,wd,suffix)
```

Arguments

ResultData	Haul data table according to MEDITS protocol (TA).
year	reference year for the analysis
wd	Working directory selected by the user.
suffix	Suffix string of the Logfile.

Details

Start depth and end depth of each haul should be in the same stratum. The strata are the ones defined according to the MEDITS protocol: 10-15 m; 50-100 m; 100-200 m; 200-500m; 500-800 m.

Value

The function returns always TRUE, because the outcome of the function is a warning that does not lock the execution of the 'RoME' checks. The presence of inconsistencies in the data is reported in the logfile stored in the "Logfiles" subdirectory of the "wd" user-defined directory.

Author(s)

I. Bitetto, W. Zupa

References

For the definition of the strata, please refer to: Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd=tempdir()
year=2007
TA = RoME::TA
suffix= "2020-03-05_time_h17m44s55"
check_stratum(TA,year,wd,suffix)
```

check_stratum_code	<i>Function to check the correct codification of the strata in haul data table (TA).</i>
--------------------	--

Description

This function verifies the correctness of the stratum code, following the stratification scheme table in the MEDITS protocol.

Usage

```
check_stratum_code(ResultDataTA,year,Strata,wd,suffix)
```

Arguments

ResultDataTA	Haul data table according to MEDITS protocol (TA).
year	reference year for the analysis
Strata	Stratification scheme according to MEDITS protocol.
wd	Working directory selected by the user.
suffix	Suffix string of the Logfile.

Details

This function checks if the stratum code associated to each haul is consistent with the code reported in MEDITS manual and in the table Stratification scheme, corresponding to the associated depth range.

Value

The function returns always TRUE, because the outcome of the function is a warning that does not lock the execution of the 'RoME' checks. The presence of inconsistencies in the data is reported in the logfile stored in the "Logfiles" subdirectory of the "wd" user-defined directory.

Author(s)

I. Bitetto, W. Zupa

References

For the definition of the strata, please refer to: Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
TA = RoME::TA
wd=tempdir()
year = 2007
suffix= "2020-03-05_time_h17m44s55"
check_stratum_code(TA,year,Strata=RoME::stratification_scheme,wd,suffix)
```

check_subsampling	<i>Function to warn the user about the presence of subsamples <0.1 of the total catch.</i>
-------------------	---

Description

Check if the sub-sample is smaller than the 10 percent of the total weight in the haul.

Usage

```
check_subsampling(ResultTC,year,wd,suffix)
```

Arguments

ResultTC	Biological data table (TC).
year	reference year for the analysis.
wd	Working directory selected by the user.
suffix	Suffix string of the Logfile.

Details

This function give a warning, reported in the Logfile, if the sub-sample is unusually small respect to the total catch of the species.

Value

The function returns always TRUE, because the outcome of the function is a warning that does not lock the execution of the 'RoME' checks. The presence of inconsistencies in the data is reported in the logfile stored in the "Logfiles" subdirectory of the "wd" user-defined directory.

Author(s)

I. Bitetto, W. Zupa

References

For the definition of the strata, please refer to: Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
TC = RoME::TC
year=2007
wd=tempdir()
suffix= "2020-03-05_time_h17m44s55"
check_subsampling(TC,year,wd,suffix)
```

check_swept_area	<i>Check Swept Area Calculation and Plot</i>
------------------	--

Description

Performs data validation and swept area calculation for MEDITS TA-format data. The function verifies numeric consistency in key columns, computes mean depth and swept area, logs any detected issues, and generates a plot of swept area versus mean depth for visual inspection.

Usage

```
check_swept_area(ResultDataTA, year, wd, suffix)
```

Arguments

ResultDataTA	A data.frame containing MEDITS hauls data in TA-format. The function uses the following columns: YEAR, VALIDITY, HAUL_NUMBER, WING_OPENING, DISTANCE, SHOOTING_DEPTH, HAULING_DEPTH, and TYPE_OF_FILE.
year	Numeric scalar. The year to be checked in the dataset.
wd	Character string. Path to the working directory where log files and plots will be saved.
suffix	Character string. Optional suffix to append to the output filenames. If NULL, a timestamp-based suffix is automatically generated.

Details

This function performs multiple validation steps on TA-format data for MEDITS hauls. It verifies that certain key columns contain numeric values and checks for missing or empty entries in critical fields such as WING_OPENING and DISTANCE.

For each haul, it calculates the mean depth as the average of SHOOTING_DEPTH and HAULING_DEPTH, and estimates the swept area in square kilometers using the formula $(WING_OPENING/10) \times DISTANCE/10^6$. Any inconsistencies or errors encountered during these checks are written to a logfile stored in the Logfiles folder. If the data contains valid entries, the function generates and saves a scatter plot showing the swept area against mean depth. The plot includes a background shading to visually separate the depth range 0-200 meters from deeper strata, assisting in the interpretation of data distribution across depth zones. All output files are organized within subfolders named Logfiles and Graphs under the specified working directory.

Value

A logical value:

- TRUE if no errors were detected in the data.
- FALSE if at least one error was found and logged.

Author(s)

W. Zupa

Examples

```
# Define working directory
wd <- tempdir()

# Load data
ResultDataTA <- RoME::TA

# Filter for specific area if needed
ResultDataTA <- ResultDataTA[ResultDataTA$AREA == 18, ]

# Run the check for year 2005
check_swept_area(ResultDataTA, year = 2005, wd = wd, suffix = NULL)
```

check_temperature	<i>Function to check the consistency of the temperature data stored in haul data table (TA).</i>
-------------------	--

Description

This function checks if the temperature by haul is in the range 10-30 Celsius degrees; moreover, a plot depth versus temperature is produced and stored in the Graph folder.

Usage

```
check_temperature(ResultDataTA, year, wd, suffix)
```

Arguments

ResultDataTA	Haul data table according to MEDITS protocol (TA).
year	reference year for the analysis.
wd	Working directory selected by the user.
suffix	Suffix string of the Logfile.

Details

This check uses the temperature range 10-30 Celsius degrees to provide quantitative warning and a plot, automatically stored in Graphs, for a qualitative inspection of that temperature data respect to depth.

Value

The function returns always TRUE, because the outcome of the function is a warning that does not lock the execution of the 'RoME' checks. The presence of inconsistencies in the data is reported in the logfile stored in the "Logfiles" subdirectory of the "wd" user-defined directory.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
TA = RoME::TA
year=2012
wd=tempdir()
suffix="2020-03-05_time_h17m44s55"
check_temperature(TA,year,wd,suffix)
```

check_TE_TC	<i>Function to verify the consistency between individual data table (TE) and biological data table (TC) respect to number of individuals.</i>
-------------	---

Description

Check if the individuals by species, length, sex and maturity stage reported in TE are less than the number reported in TC

Usage

```
check_TE_TC(ResultDataTC,ResultDataTE,year,wd,suffix)
```

Arguments

ResultDataTC	Biological data table(TC).
ResultDataTE	Individual data table (TE).
year	reference year for the analysis.
wd	Working directory selected by the user.
suffix	Suffix string of the Logfile.

Details

This function gives an error message, thus the execution is stopped if in TE are reported individuals not present in TC and if the number of individuals reported in TE is greater than the ones in TE; the user is informed in the Logfile.

Value

The function returns TRUE if there is no error, while FALSE if there is one or more errors. The run, in case of error, thus, is stopped.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd=tempdir()
suffix= "2020-03-05_time_h17m44s55"
tc <- RoME::TC
te <- RoME::TE
year=2012
check_TE_TC(tc,te,year,wd,suffix)
```

check_type

Consistency check of TYPE_OF_FILE field

Description

The function checks if the correct value for TYPE_OF_FILE field is reported in each data table. This is a global function that runs with the data frames not filtered by year.

Usage

```
check_type(TA, TB, TC, TE, TL, years, wd, Errors)
```

Arguments

TA	Haul data table according to MEDITS protocol (TA)
TB	Catch data table according to MEDITS protocol (TB)
TC	Biological data table according to MEDITS protocol (TC)
TE	Individual biological data table according to MEDITS protocol (TE)
TL	Litter data table according to MEDITS protocol (TL)

years	list of the unique YEAR values in haul data (TA) table
wd	working directory path defined by the user
Errors	logfile name

Details

TA, TB and TC tables are mandatory while TE and TL could be used where available (otherwise use NA value).

Value

The function returns FALSE when errors are detected in the TYPE_OF_FILE field of the data tables.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
TL = NA
years <- unique(RoME::TA$YEAR)
Errors <- file.path(wd,"Logfiles","Logfile.dat")
check_type(TA=RoME::TA,TB=RoME::TB,TC=RoME::TC,
TE=NA,TL=NA,years=years,wd=wd,Errors=Errors)
```

check_unique_valid_haul

Function checking that among hauls with the same code, only one must be valid.

Description

Check the presence of unique valid haul codes.

Usage

```
check_unique_valid_haul(ResultDataTA,year,wd,suffix)
```

Arguments

ResultDataTA	Haul data table according to MEDITS protocol (TA).
year	reference year for the analysis.
wd	Working directory selected by the user.
suffix	Suffix string of the Logfile.

Details

This function produce an error, stopping the check procedure to avoid cascade errors.

Value

The function returns TRUE if no error occurs, while FALSE is returned when there is more than one valid hauls. In the logfile is reported the list of all the records in which the inconsistency is detected.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
TA = RoME::TA
year=2012
wd=tempdir()
suffix= "2020-03-05_time_h17m44s55"
check_unique_valid_haul(TA,year,wd,suffix)
```

check_weight	<i>Check consistency between total weight and number of individuals in MEDITS TB data.</i>
--------------	--

Description

This function performs quality checks on the consistency between the total weight and the total number of individuals recorded in the MEDITS TB table. The consistency check is carried out both quantitatively-using known reference ranges of mean weights for each species-and qualitatively-via plots displaying the observed mean weights for each species across hauls.

Usage

```
check_weight(ResultDataTB, year, DataTargetSpecies, wd, suffix)
```

Arguments

ResultDataTB	Catch data table formatted according to the MEDITS protocol (table TB). This data includes information on species, number of individuals, and total weight per haul.
year	Reference year for the analysis. Only hauls from the specified year will be analysed.
DataTargetSpecies	Table providing reference weight ranges for species. It contains the lower (5th percentile) and upper (95th percentile) bounds for the mean weight of individuals per species, based on historical data collected from 2012 to 2022 across all surveyed GSAs. This table should be kept updated to reflect the latest knowledge about species biology in the Mediterranean Sea.
wd	Working directory chosen by the user. This directory will contain subfolders where logs and plots will be saved.
suffix	Suffix string appended to the filenames of the log files. Useful for distinguishing outputs from multiple runs.

Details

The function operates in two phases:

1. Quantitative Check:

- For each record in the TB table, the mean individual weight is computed.
- If the species is listed in DataTargetSpecies, the mean weight is compared to its 5th-95th percentile reference range.
- If the mean weight falls outside this interval, a record is saved in a CSV file reporting:
 - GSA
 - Year
 - Species
 - Haul number
 - Observed mean weight
 - Reference minimum (5th percentile)
 - Reference maximum (95th percentile)
 - Type of file

2. Qualitative Check (Plots):

- For all species present in the dataset, the function generates plots of mean weight by haul, to visually check for possible outliers or abnormal variability.
- To avoid excessive plotting, only species with at least 5 observations are plotted.
- Plots display the mean weight for each haul, with haul numbers shown as labels.
- If many species qualify for plotting, the function automatically splits the plots into multiple pages, each saved as a separate JPEG file. Each JPEG file contains up to 6 plots.

Files Produced:

- *Logfile (.dat)*: Contains a short message summarising whether any outliers were detected. Detailed warnings are no longer written here but are instead stored in the CSV file.
- *CSV File*: Named as Check_Mean_Weights_Logfile_GSA<AREA>_Year<YEAR>_<suffix>.csv. Contains all observations where the mean weight falls outside the expected reference range.
- *Plots*: Saved in JPEG format in the Graphs subdirectory. Filenames include GSA, year, and a page number.

Value

This function always returns TRUE. The purpose of the function is to perform checks and report inconsistencies, but it does not interrupt the execution of other routines in the RoME package.

Author(s)

W. Zupa, I. Bitetto

References

Anonymous. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
TB <- RoME::TB
year <- 2012
wd <- tempdir()
suffix <- "2020-03-05_time_h17m44s55"
check_weight(TB, year, DataTargetSpecies, wd, suffix)
```

check_weight_tot_nb	<i>Function to check if, when the weight is not null, also the number is not null.</i>
---------------------	--

Description

If total weight is different from 0, total number must be different from 0 (only if the category of the species is different from "E") and vice versa (for all faunistic categories).

Usage

```
check_weight_tot_nb(ResultDataTB, year, wd, suffix)
```

Arguments

ResultDataTB	Catch data table according to MEDITS protocol (TB)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

In this check 'RoME' verifies if for the records with total weight not null, there is a total number not null, except for categories V, G, H, D and E, as reported in MEDITS manual.

Value

The function returns always TRUE, because the outcome of the function is a warning that does not lock the execution of the 'RoME' checks.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

wd=tempdir()
year=2012
TB = RoME::TB
suffix= "2020-03-05_time_h17m44s55"
check_weight_tot_nb(TB,year,wd,suffix)
```

check_year	<i>Consistency check of YEAR field</i>
------------	--

Description

The function check if the correct value for YEAR field is reported in each data table. This is a global function that runs with the data frames not filtered by year.

Usage

```
check_year(TA, TB, TC, TE, TL, years, wd, Errors)
```

Arguments

TA	Haul data table according to MEDITS protocol (TA)
TB	Catch data table according to MEDITS protocol (TB)
TC	Biological data table according to MEDITS protocol (TC)
TE	Individual biological data table according to MEDITS protocol (TE)
TL	Litter data table according to MEDITS protocol (TL)
years	list of the unique YEAR values in haul data (TA) table
wd	working directory path defined by the user
Errors	logfile name

Details

TA, TB and TC tables are mandatory while TE and TL could be used where available (otherwise use NA value).

Value

The function returns FALSE when errors are detected in the YEAR field of the data tables.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
years <- unique(RoME::TA$YEAR)
Errors <- file.path(wd,"Logfiles","Logfile.dat")
check_year(TA=RoME::TA, TB=RoME::TB,
TC=RoME::TC, TE=NA, TL=NA, years=years,
wd=wd, Errors=Errors)
```

classes

Class of fields

Description

Definition of field' classes for TX tables

Usage

```
data("classes")
```

Format

A data frame with 123 observations on the following 4 variables.

RDBFIS a character vector

MEDITS a character vector

table a character vector

type a character vector

Details

See Medits handbook.

Author(s)

W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
data(classes)
```

```
create_catch
```

```
Function to create the R-sufi file capt.
```

Description

This function report the information contained in the biological data table (TB) from the MEDITS protocol to the format required by R-sufi (Rochet et al., 2004).

Usage

```
create_catch(ResultDataTB, year, wd, save=TRUE)
```

Arguments

ResultDataTB	Catch data table according to MEDITS protocol (TB)
year	reference year for the analysis
wd	working directory path defined by the user
save	boolean value to save the results in a csv file

Value

The function saves by default in the files R-Sufi folder the table capt in.csv format, with suffix of the year and GSA. If save parameter is FALSE the function returns the data frame as output.

Author(s)

I. Bitetto, W. Zupa

References

Rochet M. J., V. M. Trenkel, J. A. Bertrand & J.-C. Poulard, 2004. R routines for survey based fisheries population and community indicators (R-SUFI). Ifremer, Nantes. Limited distribution.
Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
TB = RoME::TB
year = 2012
wd = tempdir()
create_catch(TB, year, wd, save=TRUE)
```

create_haul

Function to create R-sufi file containing haul data.

Description

This function reports the information contained in the haul data table (TA) from the MEDITS protocol to the format required by R-sufi (Rochet et al., 2004).

Usage

```
create_haul(ResultDataTA, year, wd, save=TRUE)
```

Arguments

ResultDataTA	Haul data table according to MEDITS protocol (TA)
year	reference year for the analysis
wd	working directory path defined by the user
save	boolean value to save the results in a csv file

Value

The function saves by default in the files R-Sufi folder the table traits in.csv format, with suffix of the year and GSA. If save parameter is FALSE the function returns the data frame as output.

Author(s)

I. Bitetto, W. Zupa

References

Rochet M. J., V. M. Trenkel, J. A. Bertrand & J.-C. Poulard, 2004. R routines for survey based fisheries population and community indicators (R-SUFI). Ifremer, Nantes. Limited distribution.
 Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
TA = RoME::TA
year = 2012
wd = tempdir()
create_haul(TA, year, wd, save=FALSE)
```

create_length	<i>Function to create the R-sufi file taille.</i>
---------------	---

Description

This function reports the information contained in the biological data table (TC) from the MEDITS protocol to the format required by R-sufi (Rochet et al., 2004).

Usage

```
create_length(ResultData,year,DataSpecies=RoME::TM_list,wd,save=TRUE)
```

Arguments

ResultData	Biological data table according to MEDITS protocol (TC)
year	reference year for the analysis
DataSpecies	TM_list reference list
wd	working directory path defined by the user
save	boolean value to save the results in a csv file

Details

For the file taille the change in maturity scale in 2006 has been taken into account: from 1994 to 2005 the males of crustaceans have stage NA, because they were not staged until 2005. From 2006 they are considered mature for the stages strictly greater than 2A as well as for females of crustaceans. Before 2006 the females of crustaceans are considered mature for stages strictly greater than 1. Bony fish and cephalopods are considered mature from stage 3 until 2005 and then they are considered mature from stage 2B. For selachians, the immature are always stage 1 and 2.

Value

The function saves by default in the files R-Sufi folder the table taille in.csv format, with suffix of the year and GSA. If save parameter is FALSE the function returns the data frame as output.

Author(s)

I. Bitetto, W. Zupa

 Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```

ResultData = RoME::TC
year=2012
DataSpecies=RoME::TM_list
wd <- tempdir()
create_length(ResultData,year,DataSpecies,wd,save=FALSE)

```

create_strata	<i>Function to create R-sufi file containing strata surface data.</i>
---------------	---

Description

This function reports the information contained in the stratification scheme for the selected area from the MEDITS protocol to the format required by R-sufi (Rochet et al., 2004).

Usage

```
create_strata(Stratification,AREA,wd,save=TRUE)
```

Arguments

Stratification	Stratification scheme according to MEDITS protocol.
AREA	String of the GSA.
wd	Working directory selected by the user.
save	boolean value to save the results in a csv file

Value

The function saves automatically in the files R-Sufi folder the table strata in.csv format, with suffix of the year and GSA. If save parameter is FALSE the function returns the data frame as output.

Examples

```

Stratification=RoME::stratification_scheme
wd <- tempdir()
AREA = 18
create_strata(Stratification,AREA,wd,save=TRUE)

```

DataTargetSpecies	<i>Length and weight ranges for relevant species</i>
-------------------	--

Description

Data frame containing information about length and individual weight ranges for relevant species, including quantiles and various statistics. It also contains metadata about faunistic category and period of relevance as target species.

Usage

```
data("DataTargetSpecies")
```

Format

A data frame with 392 observations on the following 26 variables:

SPECIES Rubincode species identifier (character).
 WMIN Minimum observed individual weight (numeric).
 WMIN05 5th percentile of individual weight (numeric).
 WMIN10 10th percentile of individual weight (numeric).
 WMIN25 25th percentile of individual weight (numeric).
 WMAX_75 75th percentile of individual weight (numeric).
 WMAX90 90th percentile of individual weight (numeric).
 WMAX95 95th percentile of individual weight (numeric).
 WMAX Maximum observed individual weight (numeric).
 LMIN Minimum observed length (numeric, in mm).
 LMIN01 1st percentile of length (numeric, in mm).
 LMIN05 5th percentile of length (numeric, in mm).
 LMIN10 10th percentile of length (numeric, in mm).
 LMIN25 25th percentile of length (numeric, in mm).
 LMAX75 75th percentile of length (numeric, in mm).
 LMAN90 90th percentile of length calculated via mean or other method (numeric, in mm).
 LMAX95 95th percentile of length (numeric, in mm).
 LMAX99 99th percentile of length (numeric, in mm).
 LMAX Maximum observed length (numeric, in mm).
 obs_in_TC Number of observations found in TC data (numeric).
 FAUNISTIC_CATEGORY Old faunistic categories (character).
 START_YEAR Year when the species started to be considered target (numeric).
 END_YEAR Year when the species stopped being considered target (numeric).
 GROUP Species group or classification (character).

head(DataTargetSpecies)
```

dd.distance	<i>Estimation of haul distance</i>
-------------	------------------------------------

Description

Function to estimate the hauls length using TA (table A, hauls data) with coordinates in the decimal degrees format (dd.ddd). The distances could be returned expressed in meters, kilometers and nautical miles.

Usage

```
dd.distance(data, unit = "m", verbose=TRUE)
```

Arguments

data	data frame of the hauls data (TA, table A)
unit	string value indicating the measure unit of the distance. Allowed values: "m" for meters, "km" for kilometers and "NM" for nautical miles.
verbose	give verbose output reporting in the output the selected measure unit of the distance.

Details

The TA file should be populated with coordinates in decimal degrees format.

Value

The function returns the vector of the distances expressed in the selected measure unit.

Author(s)

Walter Zupa

Examples

```
TA.dd <- MEDITS.to.dd(TA)
dd.distance(TA.dd, unit="km", verbose=FALSE)
```

error.table	<i>Summary table of the errors</i>
-------------	------------------------------------

Description

Function generating the error summary table.

Usage

```
error.table(check.df, check_without_errors,  
            check_without_warnings, checkName, table, Field, yea)
```

Arguments

check.df	data frame of the checks
check_without_errors	boolean variable reporting if errors were detected
check_without_warnings	boolean variable reporting if warnings were detected
checkName	string of the check name
table	reference table checked by the function
Field	field checked by check dictionary
yea	reference year

Details

The function generate the summary table of the errors detected by the RoMEcc function.

Value

The output of the function is the data frame `check.df` updated with the result of the check.

Author(s)

W. Zupa, I. Bitetto

References

graphs_TA	<i>Function for qualitative checks of shooting depth, warp length and wing opening in Haul data table (TA).</i>
-----------	---

Description

Qualitative control (by means of 2 graphs) of relation between shooting depth e warp opening and between warp length e wing opening

Usage

```
graphs_TA(DataTA, year, wd, suffix)
```

Arguments

DataTA	Haul data table according to MEDITS protocol (TA)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The function generate 2 graphs for qualitative controls.

Value

Two graphs are stored in the Graphs folder in the wd user defined directory

Author(s)

W. Zupa, I. Bitetto

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
TA = RoME::TA
year = 2012
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
graphs_TA(RoME::TA,year,wd,suffix)
```

GSAs

List of GFCM Geographical subareas (GSAs)

Description

GSAs table

Usage

```
data("GSAs")
```

Format

A data frame with 31 observations on the following 3 variables.

GSA a numeric vector

CODE a character vector

Area a character vector

Author(s)

W. Zupa

Source

<https://www.fao.org/gfcm/data/maps/gsas/en/>

References

<https://www.fao.org/gfcm/data/maps/gsas/en/>

Examples

```
data(GSAs)
str(GSAs)
head(GSAs)
```

haul_at_sea	<i>Check of haul position on sea area</i>
-------------	---

Description

The function identify the hauls that don't fall in the user defined sea area.

Usage

```
haul_at_sea(DataTA,year,seas=RoME::MedSea,verbose = TRUE)
```

Arguments

DataTA	Haul data table according to MEDITS protocol (TA)
year	reference year for the analysis
seas	polygon shapefile defining the extension of the sea area. The default MedSea dataset is referred to the Mediterranean and Black Sea area.
verbose	boolean variable returning verbose output if TRUE

Details

The function check whether the haul position falls in the polygon seas defining the extension of the reference sea area.

Value

The function returns the list of the hauls out of the seas polygon. In case only starting haul positions are out of the sea's area a data frame is returned. If both starting and end positions are out of the polygon an object of class `list` is returned.

Author(s)

W. Zupa, I. Bitetto

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
TA = RoME::TA
year = 2012
wd <- tempdir()
suffix="2020-03-05_time_h17m44s55"
haul_at_sea(TA,year, seas = MedSea, verbose = TRUE)
```

headers.conversion *Headers conversion for MEDITS tables*

Description

Headers conversion for MEDITS tables

Usage

```
headers.conversion(table, type, verbose = FALSE)
```

Arguments

<code>table</code>	data frame of the TX table
<code>type</code>	type of tables to be analysed. Allowed values: "TA", "TB", "TC", "TE", "TL"
<code>verbose</code>	boolean. If TRUE a message is printed.

Details

The functions allow to convert headers of table coming from RDBFIS data base to the MEDITS format expected from RoME package

Value

A data frame object is returned including the only allowed field

list_g1_g2

*List of G1 and G2 species***Description**

List of the target species G1 and G1 as defined by the MEDITS protocol (see MEDITS-Handbook Version 9 2017)

Usage

```
data("list_g1_g2")
```

Format

A data frame with 88 observations on the following 17 variables.

No a numeric vector of progressive number

Medit_LIST_proposal_2011 a factor with levels of the list proposed in 2011

Species_group_DCF a factor with levels of the DCF species groups

MEDITS_G1 a numeric vector of G1 species

MEDITS_G2 a numeric vector of G2 species

Group a factor with levels of groups

Old_MEDITS_list a numeric vector of the old MEDITS list

Tot_No Tot_No

Tot_W Tot_W

Ind_Length Ind_Length

Sex a factor with levels of sex

Mat_stage a factor with levels of maturity stages

Age a factor with levels of age

Ind_weight a factor with levels of Ind_weight

Date a factor with levels of Date

CODE a factor with levels CODE

English_common_name a factor with levels of common names in english language

data(list_g1_g2)
```

LW

Table of the Length-Weight parameters

Description

Table of the length-weight relationship coefficients reported by species, area and sex.

Usage

```
data("LW")
```

Format

A data frame with 460 observations on the following 5 variables.

AREA vector of the reference geographic area

SPECIES reference species for the a and b parameters

SEX reference sex for the a and b parameters

a a parameters of the length-weight relationship function

b b parameters of the length-weight relationship function

Details

Table of the length-weight relationship coefficients a and b.

Author(s)

W. Zupa

Examples

```
data(LW)
str(LW)
```

Maturity_parameters	<i>Maturity parameters</i>
---------------------	----------------------------

Description

Maturity parameters used for the checks: check_smallest_mature, check_spawning_period and check_sex_inversion

Usage

```
data("Maturity_parameters")
```

Format

A data frame with 64 observations on the following 12 variables.

Species a factor with levels the rubincodes of the species for which the information is known.

SEX a factor with levels C F M

min_L50 a numeric vector

max_L50 a numeric vector

smallest_mature_individual_observed a numeric vector

min_length_SEX_INVERSION a numeric vector

max_length_SEX_INVERSION a numeric vector

Type_of_hermaphroditism a factor with levels proterandrous protogynous

Area a factor with levels as the area of the relevant information

Start_reproductive_season a numeric vector

End_reproductive_season a numeric vector

Reference a factor with levels of the bibliographic references

Author(s)

W. Zupa

Source

Literature and others

Examples

```
data(Maturity_parameters)
```

mat_stages	<i>Table of maturity stages</i>
------------	---------------------------------

Description

Table of maturity stages

Usage

```
data("mat_stages")
```

Format

A data frame with 132 observations on the following 4 variables.

TYPE_OF_FILE a character vector

FAUNISTIC_CATEGORY a character vector

SEX a character vector

MATURITY a character vector

MATSUB a character vector

code a character vector

Details

Table of maturity stages per faunistic category. The maturity scales adopted up to 2006 is also provided.

MEDITS.to.dd	<i>Conversion of MEDITS format coordinates in decimal degrees format</i>
--------------	--

Description

Conversion of MEDITS format coordinates in decimal degrees format

Usage

```
MEDITS.to.dd(data)
```

Arguments

data	data frame of the hauls data (TA, table A) in MEDITS format
------	---

Value

The function returns the data frame of the TA table with the coordinates expressed as decimal degrees.

Author(s)

Walter Zupa

Examples

```
MEDITS.to.dd(TA)
```

MedSea	<i>Shapefile of Mediterranean and Black Sea area</i>
--------	--

Description

Polygon shapefile describing the GFCM's Geographical subareas (GSAs)

Usage

```
data("MedSea")
```

Format

The shapefile is derived from the GFCM's Geographical subareas (GSAs) shapefile

Details

Polygon shapefile describing the GFCM's Geographical subareas (GSAs) compressed with the xz type of compression.

printError	<i>Management of the error in logfile.</i>
------------	--

Description

Management of the error in logfile.

Usage

```
printError(funname,check_without_errors, stop_)
```

Arguments

funname	name of the check function.
check_without_errors	TRUE if there is no error, FALSE if there is any error.
stop_	TRUE if the 'RoME' function has to stop, FALSE if the run should continue

Value

The function updates the 'stop_' value and returns it as a logical value.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
printError("check_abundance", FALSE, FALSE)
```

printError_cc	<i>Management of the error in logfile.</i>
---------------	--

Description

Management of the error in logfile.

Usage

```
printError_cc(funname,check_without_errors, stop_)
```

Arguments

funname name of the check function.

check_without_errors TRUE if there is no error, FALSE if there is any error.

stop_ TRUE if the 'RoME' function has to stop, FALSE if the run should continue

Value

The function updates the 'stop_' value and returns it as a logical value.

Examples

```
printError_cc("check_abundance", FALSE, FALSE)
```

RoME

Multiple Checks on MEDITS Trawl Survey Data

Description

The function calls all the functions built in the package in an ordered way to perform a complete quality check of TX data available. The check is performed simultaneously on the files that can contain also data of more than one year.

Usage

```
RoME(TA, TB, TC, TE=NA, TL=NA, wd, suffix=NA,
      create_RSufi_files = FALSE, create_global_RSufi_files=FALSE,
      Year_start=NA, Year_end=NA, verbose =TRUE, Stratification=RoME::stratification_scheme,
      Ref_list=RoME::TM_list, DataTargetSpecies=RoME::DataTargetSpecies,
      Maturity=RoME::Maturity_parameters,
      ab_parameters=RoME::LW,
      stages_list=RoME::mat_stages, assTL=assTL)
```

Arguments

TA	Haul data table according to MEDITS protocol (TA)
TB	Catch data table according to MEDITS protocol (TB)
TC	Biological data table according to MEDITS protocol (TC)
TE	Individual biological data table according to MEDITS protocol (TE) if available, if TE data are not available, use NA.
TL	Litter data table according to MEDITS protocol (TL) if available, if TL data are not available, use NA
wd	working directory path defined by the user
suffix	Suffix string of the Logfile, in case it suffix=NA it is automatically generated by the function using date and time of the check
create_RSufi_files	boolean variables used to choose if create R-sufi files. The files are saved in the R-sufi directory and named with a suffix of the year and GSA
create_global_RSufi_files	boolean variables used to choose if global R-sufi files should be created from an year to another year
Year_start	numeric value indicating the starting year for the production of R-sufi file. This parameter must to be reported in case
Year_end	numeric value indicating the ending year for the production of R-sufi files
verbose	...
Stratification	Stratification scheme according to MEDITS protocol.
Ref_list	TM_list reference list
DataTargetSpecies	Information related to target species.
Maturity	Information related to sex and maturity from literature or other sources.
ab_parameters	dataframe containing the a and b parameters of the length-weight relationships
stages_list	Table of maturity stages.
assTL	data frame with the association between TL (litter table) categories and sub-categories

Details

RoME checks can be used to integrate a list of common quality checks on survey data. This function calls all the functions built in the package in an ordered way to perform a complete quality check of TX data available. The order of the checks in RoME was implemented in a defined sequence to avoid cascade errors due to the correction of a previous error. No automatic correction is implemented in 'RoME'. 'RoME' stops if an error occurs; then the user has to correct the error and run again the code to continue with the other checks. The function runs on a complete time series dataset, checking year after year, until the end of the time series. After the checks of the mandatory fields and the controlled vocabulary, that are carried out for all the TX tables, the specific checks on each kind of TX table are performed. Finally, RoME provides a list of cross checks aimed to guarantee the consistency among the data tables.

Some functions included in the 'RoME' library and used by RoME function need specific dictionaries or tables. It is the case of Stratification, Ref_list, DataTargetSpecies, Maturity_parameters, mat_stages and assTL tables. All of them are provided by default in this library. Anyway, the user has the possibility to provide *ad hoc* modified versions of these tables adapting the checks to specific needs.

Value

The function does not correct data, but it detects the errors, warning the user that there is the possibility of one or more errors, specifying the type of the error and easing the data correction. If parameter verbose=TRUE returns a series of text output in console to let the user to trace the state of the checks. All the output of the functions are stored in the user defined working directory wd and in the sub-directory there resident. In the Lofile subfolder are stored the logfiles of each run of the function.

Author(s)

I. Bitetto, W. Zupa

References

Anonymus. 2017. MEDITS-Handbook. Version n. 9. MEDITS Working Group. 106 pp.

Examples

```
wd <- tempdir()
suffix=NA
DataTA = RoME::TA
DataTB = RoME::TB
DataTC = RoME::TC
DataTE = NA
DataTL = NA
RoME(DataTA, DataTB,DataTC,DataTE,DataTL, wd, suffix,
  Stratification=RoME::stratification_scheme,
  Ref_list=RoME::TM_list,DataTargetSpecies=RoME::DataTargetSpecies,
  Maturity=RoME::Maturity_parameters,ab_parameters=RoME::LW,
  stages_list=RoME::mat_stages,assTL=RoME::assTL)
```

Description

The function RoMEBScc performs a full suite of automated, non-stopping quality checks on survey data for the Black Sea. It invokes the same sequence of validation routines as RoMEcc (for TA, TB, TC, TE and TL tables) but uses tables and parameters tailored to Black Sea strata, species and maturity references.

Usage

```
RoMEBScc(
  TA,
  TB,
  TC,
  TE = NA,
  TL = NA,
  wd,
  suffix = NA,
  verbose = TRUE,
  Stratification = RoME::stratification_scheme,
  Ref_list = RoME::TM_list,
  DataTargetSpecies = RoME::DataTargetSpecies,
  Maturity = RoME::Maturity_parameters,
  ab_parameters = RoME::LW,
  stages_list = RoME::mat_stages,
  assTL = RoME::assTL,
  zip = TRUE
)
```

Arguments

TA	Haul metadata table (TA)
TB	Catch data table (TB)
TC	Biological data table (TC)
TE	Individual biological data table (TE), or NA if unused.
TL	Litter table (TL), or NA if unused.
wd	Working directory path where "Logfiles" and "Graphs" subfolders are written.
suffix	Character suffix for output filenames. If NA, a timestamp is auto-generated.
verbose	Logical; if TRUE, progress messages are printed to the console.
Stratification	Stratification scheme object; defaults to RoME::stratification_scheme.
Ref_list	Reference list for tow metadata; defaults to RoME::TM_list.
DataTargetSpecies	Species-specific reference dataset; defaults to RoME::DataTargetSpecies.
Maturity	Maturity-parameter table; defaults to RoME::Maturity_parameters.
ab_parameters	Length-weight parameter table; defaults to RoME::LW.
stages_list	Maturity-stage lookup table; defaults to RoME::mat_stages.
assTL	Category-subcategory mapping for TL; defaults to RoME::assTL.
zip	Logical; if TRUE, a ZIP archive of results is created at the end.

Details

RoMEBScc checks can be used to integrate a list of common quality checks on survey data from Black Sea. This function calls all the functions built in the package in an ordered way to perform a complete quality check of TX data available. The order of the checks in RoME was implemented in a defined sequence to avoid cascade errors due to the correction of a previous error. No automatic correction is implemented in 'RoME'. 'RoME' stops if an error occurs; then the user has to correct the error and run again the code to continue with the other checks. The function runs on a complete time series dataset, checking year after year, until the end of the time series. After the checks of the mandatory fields and the controlled vocabulary, that are carried out for all the TX tables, the specific checks on each kind of TX table are performed. Finally, RoME provides a list of cross checks aimed to guarantee the consistency among the data tables.

Some functions included in the 'RoME' library and used by RoME function need specific dictionaries or tables. It is the case of Stratification, TM_list, DataTargetSpecies, Maturity_parameters, mat_stages and assTL tables. All of them are provided by default in this library. Anyway, the user has the possibility to provide *ad hoc* modified versions of these tables adapting the checks to specific needs.

Value

The function does not correct data, but it detects the errors, warning the user that there is the possibility of one or more errors, specifying the type of the error and easing the data correction. If parameter verbose=TRUE returns a series of text output in console to let the user to trace the state of the checks. All the output of the functions are stored in the user defined working directory wd and in the sub-directory there resident. In the Lofile subfolder are stored the logfiles of each run of the function.

  verbose = FALSE
)
```

Description

The function calls all the functions included in the package in an ordered way to perform a complete quality check of TX data available. The check is performed simultaneously on the files that can contain also data of more than one year. Unlike the RoME function, RoMEcc does not stop at the first detected error, allowing user to correct data. Instead, it checks all the data and returns a report on the errors found, as well as compiling a detailed log file.

Usage

```
RoMEcc(TA, TB, TC, TE=NA, TL=NA, wd, suffix=NA,
       verbose =TRUE, Stratification=RoME::stratification_scheme,
       Ref_list=RoME::TM_list, DataTargetSpecies=RoME::DataTargetSpecies,
       Maturity=RoME::Maturity_parameters,
       ab_parameters=RoME::LW,
       stages_list=RoME::mat_stages, assTL=RoME::assTL, zip=TRUE)
```

Arguments

TA	Haul data table according to MEDITS protocol (TA)
TB	Catch data table according to MEDITS protocol (TB)
TC	Biological data table according to MEDITS protocol (TC)
TE	Individual biological data table according to MEDITS protocol (TE) if available, if TE data are not available, use NA.
TL	Litter data table according to MEDITS protocol (TL) if available, if TL data are not available, use NA
wd	working directory path defined by the user
suffix	Suffix string of the Logfile, in case it suffix=NA it is automatically generated by the function using date and time of the check
verbose	...
Stratification	Stratification scheme according to MEDITS protocol.
Ref_list	TM_list reference list
DataTargetSpecies	Information related to target species.
Maturity	Information related to sex and maturity from literature or other sources.
ab_parameters	dataframe containing the a and b parameters of the length-weight relationships
stages_list	Table of maturity stages.
assTL	data frame with the association between TL (litter table) categories and sub-categories
zip	boolean, if TRUE a zip file containing the results is generated

Details

RoMEcc checks can be used to integrate a list of common quality checks on survey data. This function calls all the functions built in the package in an ordered way to perform a complete quality check of TX data available. The order of the checks in RoME was implemented in a defined sequence to avoid cascade errors due to the correction of a previous error. No automatic correction is implemented in 'RoME'. 'RoME' stops if an error occurs; then the user has to correct the error and run again the code to continue with the other checks. The function runs on a complete time series dataset, checking year after year, until the end of the time series. After the checks of the mandatory fields and the controlled vocabulary, that are carried out for all the TX tables, the specific checks on each kind of TX table are performed. Finally, RoME provides a list of cross checks aimed to guarantee the consistency among the data tables.

Some functions included in the 'RoME' library and used by RoME function need specific dictionaries or tables. It is the case of Stratification, TM_list, DataTargetSpecies, Maturity_parameters, mat_stages and assTL tables. All of them are provided by default in this library. Anyway, the user has the possibility to provide *ad hoc* modified versions of these tables adapting the checks to specific needs.

Value

The function does not correct data, but it detects the errors, warning the user that there is the possibility of one or more errors, specifying the type of the error and easing the data correction. If parameter verbose=TRUE returns a series of text output in console to let the user to trace the state of the checks. All the output of the functions are stored in the user defined working directory wd and in the sub-directory there resident. In the Lofile subfolder are stored the logfiles of each run of the function.

Examples

```
wd <- tempdir()
suffix=NA
DataTA = data.frame(RoME::TA[RoME::TA$YEAR==2012 ,])
DataTB = data.frame(RoME::TB[RoME::TB$YEAR==2012 ,])
DataTC = data.frame(RoME::TC[RoME::TC$YEAR==2012 ,])
DataTE = NA
DataTL = NA
RoMEcc(DataTA, DataTB, DataTC, DataTE, DataTL, wd, suffix,
  Stratification=RoME::stratification_scheme,
  Ref_list=RoME::TM_list, DataTargetSpecies=RoME::DataTargetSpecies,
  Maturity=RoME::Maturity_parameters, ab_parameters=RoME::LW,
  stages_list=RoME::mat_stages, assTL=RoME::assTL, verbose=FALSE)
```

RSufi_files	<i>Function to concatenate the R-sufi files of the different years.</i>
-------------	---

Description

When the check procedure is completed for a number of years, it is possible to obtain the 4 R-Sufi global files from an year to another year.

Usage

```
RSufi_files(Year_start,Year_end,AREA,wd)
```

Arguments

Year_start	Start year
Year_end	Start end
AREA	String of the GSA. Include only the number.
wd	working directory path defined by the user

Value

The function saves automatically in the files R-Sufi folder the 4 global files, with suffix of the year range and GSA.

Examples

```
TA = RoME::TA
TB = RoME::TB
TC = RoME::TC
DataSpecies=RoME::TM_list
Stratification=RoME::stratification_scheme
year = 2012
wd <- tempdir()
create_haul(TA,year,wd,save=TRUE)
create_catch(TB,year,wd,save=TRUE)
create_length(TC,year,DataSpecies,wd,save=TRUE)
create_strata(Stratification,"10",wd,save=TRUE)
RSufi_files(2012,2012,"10",wd) # run only if you are working outside a temporary directory
```

run_RoME_app

Run the RoME Shiny application

Description

Launches the embedded Shiny application included in the package.

Usage

```
run_RoME_app()
```

Value

No return value, called for side effects

scheme_individual_data

Summary of the individual data collected by species

Description

Check for summarize the individual data collection (goodness of individual data sampling)

Usage

```
scheme_individual_data(DataTC, DataTE, year, wd, suffix)
```

Arguments

DataTC	Biological data table according to MEDITS protocol (TC)
DataTE	Individual biological data table according to MEDITS protocol (TE)
year	reference year for the analysis
wd	working directory path defined by the user
suffix	Suffix string of the Logfile

Details

The function uses biological data and individual biological data to produce a table where for each species are stored the number of length measurements, individual weights and number of otoliths taken by length class.

Value

This check has as output a table (automatically saved in the wd user defined directory) named `sampling_individual_measures.csv` where for each species are stored the number of length measurements, individual weights and number of otoliths taken by length class. This table is useful to the user to evaluate the coverage of the individual measurements collections in order to verify if the sampling is in line with the protocol and to understand how eventually improve the sampling procedure.

templateTA	Template haul data table (TA).

Description

Dataframe containing the headers of TA, according to the MEDITS manual.

Usage

data("templateTA")

Format

A data frame with 0 observations on the following 43 variables.

- TYPE_OF_FILE a logical vector
- COUNTRY a logical vector
- AREA a logical vector
- VESSEL a logical vector
- GEAR a logical vector
- RIGGING a logical vector
- DOORS a logical vector
- YEAR a logical vector
- MONTH a logical vector
- DAY a logical vector
- HAUL_NUMBER a logical vector
- CODEND_CLOSING a logical vector
- PART_OF_THE_CODEND a logical vector
- SHOOTING_TIME a logical vector
- SHOOTING_QUADRANT a logical vector

SHOOTING_LATITUDE a logical vector
SHOOTING_LONGITUDE a logical vector
SHOOTING_DEPTH a logical vector
HAULING_TIME a logical vector
HAULING_QUADRANT a logical vector
HAULING_LATITUDE a logical vector
HAULING_LONGITUDE a logical vector
HAULING_DEPTH a logical vector
HAUL_DURATION a logical vector
VALIDITY a logical vector
COURSE a logical vector
RECORDED_SPECIES a logical vector
DISTANCE a logical vector
VERTICAL_OPENING a logical vector
WING_OPENING a logical vector
GEOMETRICAL_PRECISION a logical vector
BRIDLES_LENGTH a logical vector
WARP_LENGTH a logical vector
WARP_DIAMETER a logical vector
HYDROLOGICAL_STATION a logical vector
OBSERVATIONS a logical vector
BOTTOM_TEMPERATURE_BEGINNING a logical vector
BOTTOM_TEMPERATURE_END a logical vector
MEASURING_SYSTEM a logical vector
NUMBER_OF_THE_STRATUM a logical vector
BOTTOM_SALINITY_BEGINNING a logical vector
BOTTOM_SALINITY_END a logical vector
MEASURING_SYSTEM_SALINITY a logical vector

TL	<i>TL</i>
----	-----------

Description

TL table

Author(s)

W. Zupa

TM_list	<i>TM list</i>
---------	----------------

Description

The present list is destined to code the marine species encountered in the Mediterranean. It has been built following the principle used in the Nordic Code Centre (Stockholm). For most of the species the codes are identical to those proposed by the NCC. However some species can be coded differently. In addition numerous Mediterranean species are not included in the NCC code and have been added. So the present list is specific. It has to be referred as the TM list (Taxonomic list not only Faunistic, FM list).

Usage

```
data("TM_list")
```

Format

A data frame with 1470 observations on the following 11 variables.

N. a numeric vector

MeditCode a factor with levels of species codes in the RUBIN format (see MEDITS manual)

Scientific.Name.....valid a factor with levels of the scientific names of the species

Authorship a factor with levels of the authorship of the information

Source a factor with levels sources of the information

Reference a factor with levels of the bibliographic references

Remarks a factor with levels the reported remarks

CATFAU a factor with levels of the faunistic categories of the species

CODLON a factor with CODLON that represents the Length classes code: m = 1 mm; 0 = 0,5 cm; 1 = 1 cm.

GSAs a factor with levels of the Geographic Sub-Areas (GSA) adopted in the MEDITS protocol.

Year a factor with levels of the years
